AcF 609: Financial Econometrics

Lent Term 2008

1. Objectives

- To explain how econometric methods can be used to learn about the future behaviour of the prices of financial assets, by using the information in the history of asset prices and in the prices of derivative securities.
- To provide students with practical experience of analysing market prices.

2. Learning outcomes

After completing the course students should :

- Understand the important features of time series of market prices,
- Appreciate the relevance of efficient market theory to predicting prices,
- Be familiar with appropriate methods for forecasting price volatility,
- Be able to use option prices to make statements about the distributions of future asset prices,
- Have acquired experience of applying computational methods to market data,
- Be informed about a broad range of econometric methods that are applied in Finance research.

3. Reading

The recommended course text, referred to as APDVP, is:

Stephen J. Taylor, *Asset Price Dynamics, Volatility, and Prediction*,
2007 (paperback edition), Princeton University Press, ISBN 0 691 13479 0.

The author's webpage for APDVP is:

<http://www.lancs.ac.uk/staff/afasjt/assetpricedynamics>

Photocopies of lecture notes will be provided. They include detailed information about recommended reading from APDVP.

Copies of APDVP and the following books are in the Library:

Terence C. Mills, *The Econometric Modelling of Financial Time Series*, second edition 1999, Cambridge University Press. Chapters 2, 4 and part of chapter 5 cover course material.

Ruey S. Tsay, *Analysis of Financial Time Series*, 2002, Wiley. This is a challenging text that includes advanced mathematics. Chapters 2, 3 and 5 cover course material.

Chris Chatfield, *The Analysis of Time Series*, 1996, Chapman and Hall. This is a good general text about time series. Chapters 3 and 4 are particularly relevant.

John Y. Campbell, Andrew W. Lo and A. Craig MacKinlay, *The Econometrics of Financial Markets*, 1997, Princeton University Press. This PhD textbook covers many more methods and applications than our course. Chapter 2 is particularly relevant.

Christian Gourieroux and Joann Jasiak, *Financial Econometrics*, 2001, Princeton University Press. A challenging book for 'advanced graduate students'. Chapter 2, 6 and 14 overlap most with our course.

Ser-Huang Poon, *A Practical Guide to Forecasting Financial Market Volatility*, 2005, Wiley. A short book aimed at practitioners. Chapters 10 and 11 are particularly relevant.

4. Administration

The course will be taught between January 15 and March 5 inclusive, during weeks 1 to 4 and 7 to 8 of the Lent term. Students attend twelve 90-minute lectures and four 60-minute sessions in a computer laboratory.

Venues:

Lectures: LT2 (Tuesdays, Wednesdays, Thursdays) and LT1 (Fridays).

Lab sessions: A8, Engineering Building.

Lecturer: Stephen Taylor.

Office: C27.

Consultation hours: Wednesdays 11.15 to 12.15 (commencing January 23).

e-mail: s.taylor@lancaster.ac.uk

To see Stephen Taylor, you should come to C27 during his consultation hours; if this is impossible, then please send an e-mail to arrange an appointment.

For data and other resources see:

<https://lrvle.lancs.ac.uk/acfin/609.nsf>

5. Course assessment

The examination in April counts for 75% of the assessment. Students will probably be required to answer two questions: one compulsory question and one of the other three questions on the exam paper. The exam is “closed book” and its duration is expected to be two hours.

A coursework assignment, that counts for 25%, will be distributed on or before February 8 with a deadline of March 14. The assignment will require calculations using market prices.

6. Syllabus

The contents of the lectures may be varied slightly from the following schedule.

Lectures 1 & 2, Probability foundations

Tuesday 15 January, 9.15 to 10.45 & Wednesday 16 January, 11.00 to 12.30

Overview of the course. Time series notation. Prices, returns and volatility clustering.

Probability concepts – random variables, density functions, independence, conditional distributions and expectations.

Stochastic processes – autocorrelations, uncorrelated processes, autoregressive, moving-average and integrated components. Examples of ARMA models for financial returns.

APDVP reading: Chapters 1, 2 and 3.

Additional reading:

- For elementary probability: P. Newbold, W.L. Carlson and B.M. Thorne, *Statistics for Business and Economics*, Prentice-Hall, 2003 (fifth edition), parts of Chapters 4, 5 and 6.
- For ARMA models: Sections 2.1 to 2.6 of Tsay, Chapter 2 of Mills, Chapters 3 and 4 of Chatfield and Chapter 2 of Gouriéroux and Jasiak are relevant.

Lecture 3, Stylised facts for returns from financial assets

Tuesday 22 January, 9.15 to 10.45

The common properties of time series of daily financial returns. Their means, standard deviations and distributions. Calendar properties. Correlations between returns on different days. Autocorrelations of absolute returns and squared returns.

APDVP reading: Chapter 4.

Additional reading: Return distributions are discussed in Mills, Chapter 5.

Computer workshop 1**Wednesday 23 January, 9.00 to 10.00 (Group A) and 10.00 to 11.00 (Group B)**

Students attend **one** 60-minute class. The allocation of students to groups will be provided in a separate document.

Lectures 4 & 5, Expected returns using time series information**Friday 25 January, 9.15 to 10.45 & Tuesday 29 January, 9.15 to 10.45**

The random walk hypothesis and its relationship to market efficiency. Testing for a random walk process using the variance-ratio test. Methods that use trading rules to assess the predictability of returns and the efficiency of markets. The moving-average trading rule and conclusions from its use.

APDVP reading: Chapter 5 and 7.

Additional reading: Return predictability is covered in Campbell et al, Chapter 2.

Computer workshop 2**Wednesday 30 January, 9.00 to 10.00 (Group B) and 10.00 to 11.00 (Group A)**

Students attend one 60-minute class.

Lectures 6 & 7, Modelling changes in volatility using time series information**Thursday 31 January, 11.00 to 12.30 & Tuesday 5 February, 9.15 to 10.45**

Reasons for changes in volatility. The autoregressive conditional heteroscedasticity (ARCH) framework. Statistical properties, computational methods, hypothesis tests, examples. Forecasting future volatility using previous returns.

APDVP reading: Chapters 8, 9 and 10.

Additional reading: Sections 3.1 to 3.6 of Tsay, Chapter 4 of Mills and some of Chapter 6 of Gouriéroux and Jasiak are relevant.

Computer workshop 3**Wednesday 6 February, 9.00 to 10.00 (Group A) and 10.00 to 11.00 (Group B)**

Students attend one 60-minute class.

Lecture 8, High-frequency analysis of market prices**Friday 8 February, 9.15 to 10.45**

Typical data and methods for prices recorded every five minutes. The impact of scheduled news. Measures of realised volatility. The information content of the additional information provided by high-frequency data.

APDVP reading: Chapter 12.

Additional reading: Section 5.3 of Tsay and Chapter 14 of Gouriéroux and Jasiak.

Lecture 9, Volatility expectations implied by options prices**Tuesday 26 February, 9.15 to 10.45**

The definition of implied volatility and computational methods. Typical patterns in implied volatility as either the time to expiry or the exercise price varies. Forecasting volatility using option prices and comparisons with time series forecasts.

APDVP reading: Chapters 14 and 15.

Additional reading: Hull, J., 2000, *Options, Futures and Other Derivatives* (fourth edition), chapter 17, Prentice-Hall, or 2003 (fifth edition), chapter 15.

Computer workshop 4**Wednesday 27 February, 9.00 to 10.00 (Group B) and 10.00 to 11.00 (Group A)**

Students attend one 60-minute class.

Lectures 10 and 11, Probability distributions implied by options prices**Friday 29 February, 11.00 to 12.30 & Tuesday 4 March, 9.15 to 10.45**

Methods that use several option prices to estimate a probability density for the asset price when the options expire. Mixtures of lognormal distributions. A review of other methods. Examples for the U.K. equity market.

APDVP reading: Chapter 16.

Lecture 12, A review of some further econometric methods**Wednesday 5 March, 9.15 to 10.45**

Some or all of: generalized method of moments, principal components analysis, factor analysis, cointegration, vector autoregressive models.
