

Jareth Disley

Visualising the Internet Movie Database

B.Sc. Computer Science

25th March 2011

Abstract

This project introduces the Internet Movie Database and the relationships that are present within its large volume of information. The aims of the project are to parse and process movie data and visualise the relationships within it. The aim of parsing is to extract and store the relevant information, so that the data can then be processed to allow the relationships to be visualised.

Working documents from throughout the project can be found at the following web address:
