

# Multidisciplinary Security Research @LU

Security Lancaster is one of the largest interdisciplinary security research institutes in the UK with 120 staff from 15 academic departments. It is home to Lancaster University's Cyber Security Research Centre (CSRC), the ESRC UK national hub for social science research on security threats (CREST) and the EPSRC Trustworthy Autonomous Systems Node in Security (TAS-S).

As a University Institute, Security Lancaster draws on excellence from across the University to deliver world class research and education that challenges the way individuals, organisations, and societies secure and protect themselves. We deliver several Masters and professional development programmes (e.g., MSc in Cyber Security), and fosters a collegiate and innovative research environment through year-round activities.

Our cross-disciplinary socio-technical research is actively complemented by policy engagement and education to deliver innovative solutions to today's complex security challenges that affect people and societies.

We further cultivate innovation and entrepreneurship by facilitating the exchange of ideas and information through the sharing of facilities, the creation of networks of like-minded individuals, and through the development of a 'social infrastructure'. We bring together people from government, business, academia and the protection industries to create new perspectives on security, innovation and responsible entrepreneurship in a rapidly changing world.

## Research Themes

The Institute is driven by an ethos of undertaking theoretically rich, user-inspired research. We accomplish this by building on long-established collaborations with organisations and government departments from a range of sectors and scales.
